.17 vpn client is 5 free My VS 2015 host is x64, while the target is x86. I have tried the following: Selecting "Build now" from the Build menu. From the Build menu, selecting the Configuration dropdown. From the Configuration dropdown, selecting "Any CPU". I'm running the application on my local machine. I've installed Visual Studio in both 64 bit and 32 bit mode. I'm using .Net 4.6.1. I've seen other solutions but they either didn't work for me or I didn't understand them. A: With a little help from the chat room (thanks again), I got it. Right click on the project in Solution Explorer and select properties. In the "Build" tab, make sure "x86" is selected for platform. In the "Platform" tab, make sure "Any CPU" is selected for configuration. The present invention relates to a semiconductor device, and more particularly, to a semiconductor device having a recessed transistor and a method for fabricating the semiconductor device. A semiconductor device for a large capacity memory device,

for example, is formed of a plurality of cell regions. The plurality of cell regions includes a cell region used for normal operation and a cell region used for a test operation, in which the test operation is carried out before shipment of the memory device. A plurality of memory cells are formed in the cell region for the normal operation. The plurality of memory cells are divided into a group of memory cells having a data state, for example, "1" and a group of memory cells having a data state "0", and a plurality of sense amplifier circuits are included in the cell region for the normal operation. The group of memory cells having a data state "1" includes memory cells having a voltage greater than a power voltage applied to the semiconductor device, for example, memory cells in an erased state and memory cells in a program state. The group of memory cells having a data state "0" includes memory cells having a voltage less than the power voltage, for example, memory cells in an erased state and memory cells in a program state. A bit line is provided to each of the sense amplifier circuits. The group of memory cells having a data state "1" are connected to the bit lines provided to the sense amplifier circuits. The group 82157476af
